

Applying for the data science position

Reza

April 07, 2016

Dear

I am writing to express my interest in working with zapier as data scientist. I am doing the last steps of doctorate in Mathematics in FSU Jena Germany. I have plenty of experience in reseach and teaching. Alognside pure math, I cooperated with experts in other fields including economists and urban planners.

To name some, I developed an algorithm for assessing accessibility in cities using big graphs and programmed it in MatLab. I also am familiar with, by nature statistical, techniques of remote sensing, and help urban planners running them through R programming. Togehter with economists, we studied financial derivatives with aim of understanding their nature and their relationship with gambling.

Now after several years of mainly doing academic jobs, I would like to enter to a more practical yet active sector and found the data analysis really interesting and perfectly fitted to my theoretical background. In the university and otehr trainings, I did several cources in Statistics, Statistical inference, operational research, phylosophy of science, machine learning, prgramming and data structures as well as data banks and SQL. I am already advanced in R programming and familiar with python.

In terms of transferable skills, I learned how to translate real world problems into mathematical statements and vice versa. I am good in analysing and problem solving as key skills in mathematics. I did cooperated with teams of different scientific and social backgrounds. Also for several years I thought mathematics to students of various scientific and social backgrounds and practiced expressing complicated problems in understandable manners.

I tought math, in which the biggest challenge is expressing complicated problems in understandable manners. Also doing research and other expreiences, I learned how to translate real world problems into mathematical statements and vice versa. I am an independent fast leaner with good analytical strength. During the last couple of months I learned SQL and R programming and using it in data analysis. I already am familiar with Python as well and would like to learn it more deeply.

You can find some works of mine in my github account

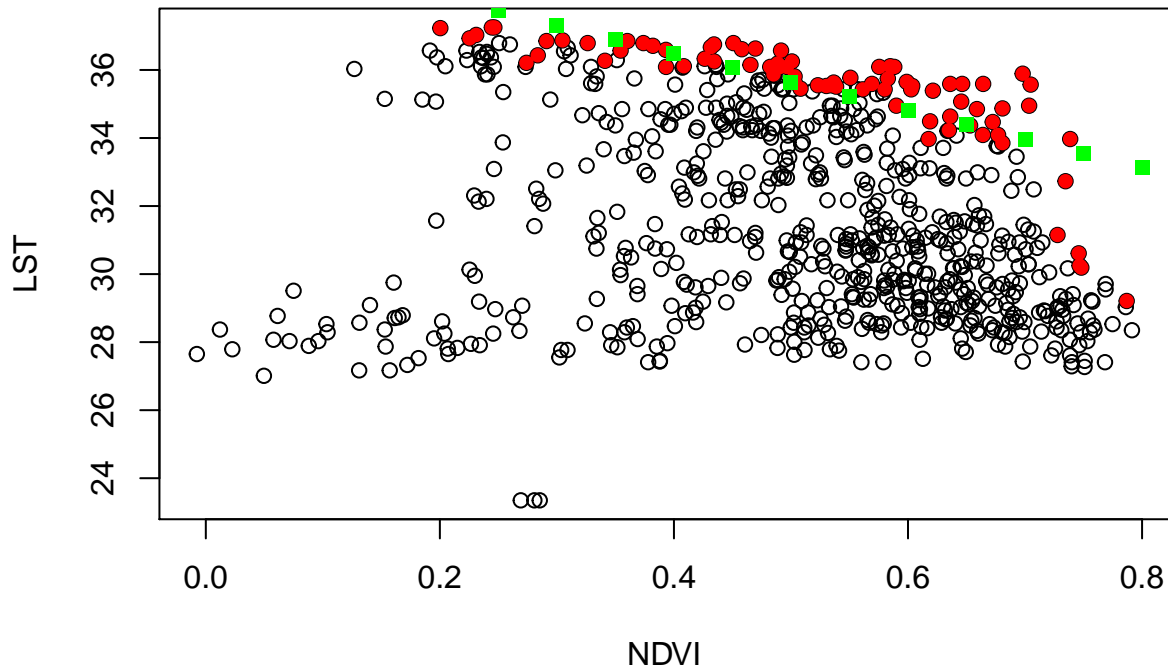

In R I love the “dplyr” and “data.table” packages for their fast and efficient capability of cleaning and summarizing the data. “raster” is a very nice package for working with grid ?data?. For plotting one should not underestimate the base plotting system of R but whenever it is too much coding needed using it, I prefer to use “ggplot2”. Rmarkdown in combination with LaTeX is a great tool for making reports. In machine learning techniques, neural network is really good however sometimes I found it is too slow. Random forest worked quite good.

Explanation of a work

MODIS is a satellite which provides mainly two kind of products. First, land surface temperature (LST) and second Normalized Difference Vegetation Index (NDVI), an index between -1 and 1 of which higher values indicate more dense vegetation. This data are provided in weekly intervals. The problem is that it is really coerce, with resolution of 960m. On the other hand we had an image of the SPOT satellite of 1.5m resolution which unfortunately does not provide LST information but fortunately provides enough data for computing NDVI. On the other hand, it is known that NDVI and LST have an inverse relationship. We use this fact to compute LST in the resolution of SPOT.

Briefly, I computed two linear models. One to convert NDVI of SPOT to NDVI of MODIS and another to convert NDVI to LST. The first one is quite straightforward. But the second model had to be based on not

all pixels but just the so called hot edge pixels. i.e. pixels which are among the hottest 5 percent when NDVI is binned in 0.3 unit intervals. Scatter plot below shows NDVI vs LST. Red dots are hot edges and green squares indicate the fitted linear model.

To refine the results, I used the fact that the temperature of a point is dependent to its surrounding points. To take into account this fact, I computed the residuals of the model above with respect to all pixels. Then trained a neural network with NDVI values of each pixel and its eight surrounding pixels as input and the pixels residual as output.

The

As I understand that my resume might not be yet convincing to give me a full job, I would like to propose a two-month unpaid remote trainee program. I would do the jobs you expect from a data analyst. I am sure I can rapidly learn whatever needed for the job and I haven't learned yet. After then I would have a job or at least a priceless experience working with Zapier.

Enclosed please find my resume. I am looking forward to hearing from you and ready to start from April.

With highest regards

Reza Hosseini
